2011 San Luis Obispo County Board of Supervisor Redistricting

Impacts of Proposed Alternatives on Dominant Political Party in Each District

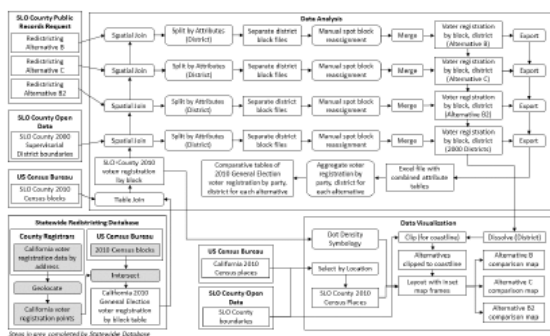

by Thomas Arndt

Introduction

Every ten years, counties in California are required to adjust their supervisorial district boundaries to account for population changes as determined by the federal Census (California Elections Code 1994). Following the 2010 Census, in 2011 the San Luis Obispo County Board of Supervisors considered three final redistricting options developed by County staff to satisfy equal population requirements, and ultimately voted to approve the current district boundaries from this list (Board of Supervisors 2011b). While state law prohibits supervisors from making redistricting decisions to favor a particular political party (California Elections Code 1994), the impact of each reapportionment option on the dominant political party in each district would have been important to the Supervisors, both within their own districts and for the Board as a whole. In the first Supervisorial election following the 2011 redistricting, liberal-leaning Supervisor Patterson lost the District 5 seat to conservative-leaning Supervisor Arnold, shifting the Board ideological majority from liberal to conservative. By moving voters between districts, the 2011 redistricting process may have contributed to this ideological shift. This study uses spatial analysis to examine the potential impact of each 2011 redistricting option on the dominant political party in each district, and on the Board as a whole.

Methods

Census blocks (US Census Bureau 2011) with voter registration data (Statewide Database 2011) were grouped according to redistricting Alternatives B, C, and B2 developed by the County (Savage 2020) and compared to the boundaries prior to redistricting (County of San Luis Obispo 2020) to determine the partisan movement of voters under each option.

Results/Conclusion

The similarities in voter apportionment by political party among the three options suggest that partisan affiliation was not a substantial factor in the redistricting decision. While there were partisan implications of all redistricting alternatives, namely the increase in Republican voter margin in District 5, none of the proposed alternatives shifted the dominant party on the Board as a whole, nor within any individual district. In fact, based on voter registration alone, Republicans were the dominant political party for the County as a whole, both before redistricting and under each alternative proposed. This is seemingly at odds with the Board composition at the time, with liberal-leaning Supervisor Patterson representing Republican-dominated District 5. However, the resulting datasets carry limitations in interpretation and real-world application. These methods do not capture voter behavior, which in practice varies from voter registration. Not all registered voters cast ballots in every election for every contest, and those that do are not beholden to allegiance towards their registration party. Furthermore, a large portion of San Luis Obispo County voters are either nonpartisan by registration or belong to a minor political party, and the significance of moving such voters is more difficult to assess.

Despite the observed ideological shift on the San Luis Obispo County Board of Supervisors following the 2011 redistricting decision, the new district boundaries did not appear to substantially alter the partisan makeup of any one district, nor the Board as a whole. However, the methods developed in this study can be applied to evaluate future redistricting alternatives proposed in California, provided the Statewide Database is updated with concurrent data. The next redistricting process for San Luis Obispo County will take place in 2021 following the completion of the 2020 Census (California Elections Code 1994) using

About This Map

This map displays the the top 10 worst traffic intersection in the City of Bakersfield from 2016 to 2019. Intersection rankings were determined by how many accidents occurred in or around the traffic intersection. Click on the layer list to turn on or off the data layers by year. Data is from the Transportation Injury Mapping System (TIMS) as well as the Bakersfield City GIS Department.

In addition to performing a spatial analysis to identify the traffic intersections where the most collisions occurred, an analysis to determine the most associated land uses with collisions by year was performed. Associated land uses were identified by finding what zones accidents fell in by buffering the city's zoning shapefile. The analysis time frame was from 2016 to 2019 and data for each year can be seen in the pie charts below.

Legend

Archaeological Investigations and Resources within the Pismo Coast

Kelli Wathen

INTRODUCTION

The Pismo Coast of California has a rich prehistoric past that has yet to be collated into one resource. Most of the archaeological studies have been performed in small areas due to the highly developed land and property boundaries. For this reason, studies on a large scale are not likely possible. However, the indigenous people living on this land for thousands of years prior to European contact did not conform to these same boundaries and the remains of their lives and communities are scattered throughout the coastal area. In order to get a better picture of the Pismo Coast's archaeological resources, this study examines the amount of the Pismo Coast that has been investigated, and faunal resources from two sites in the coastal study area.

METHODOLOGY

The Pismo Coastline was digitized from topographic basemaps. A 1.5 kilometer buffer was created to it to signify the Study Area. All archaeological investigations were digitized and merged, and the area was calculated. Due to the large amount of investigations, only two sites were chosen to be studied further. These were chosen due to the vast amount of archaeological data and the integrity of the company who ran the investigation. Data from those reports were entered into attribute tables in order to create the chart symbology seen in Figures 2 and 3.

RESULTS

The Pismo Coastline used in this study is 12.8 km long and the 1.5 km buffer created, when halved (due to half consisting of water) is 17.5 km² of land. The merged investigations make up 6.6 km², meaning 37.7% of the Study Area has been investigated (Figure 1). Both Site A and Site B had a large assemblage of artifacts and faunal resources with equivalent artifact classes and faunal classes as well as comparable counts of artifacts.

Fig 1. Archaeological Investigations in Study Area

Fig 2. Faunal Assemblages at Sites A and B

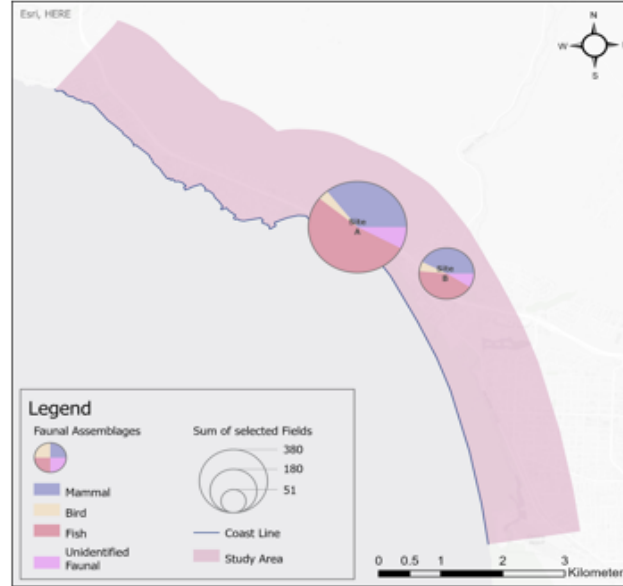

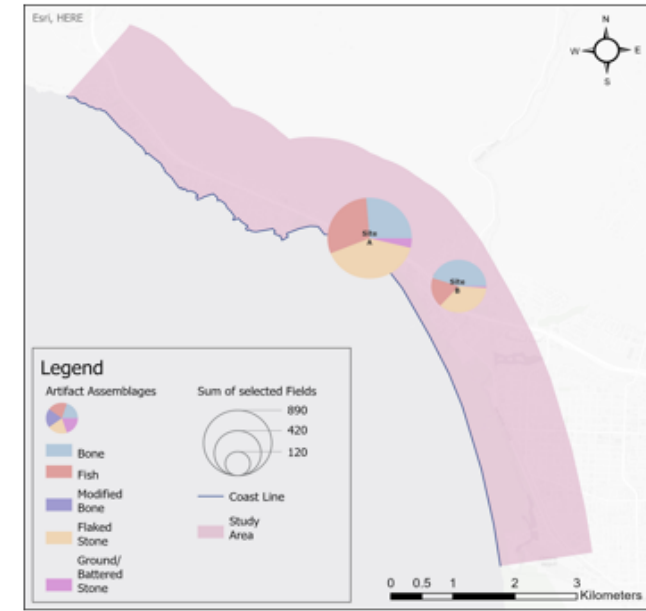

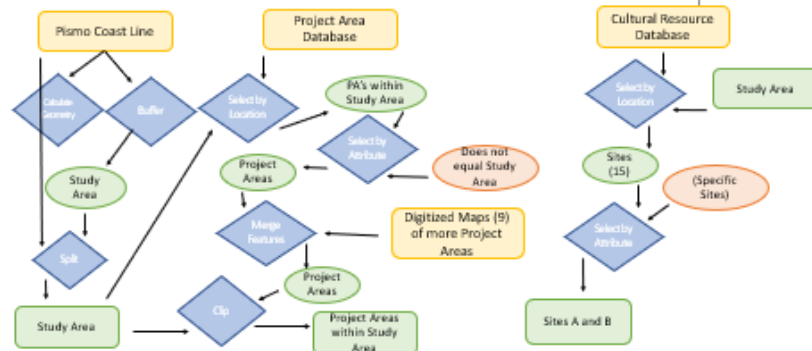

Fig. 3 Artifact Assemblages at Sites A and B

WORKFLOW

CONCLUSIONS

Archaeological investigations in the Pismo Coast Study Area consists of 37.7% of land, which is a large percentage compared to other areas throughout California. Sites A and B had comparable assemblages of artifacts and faunal, with Site A containing nearly twice as large of a collection. This may be due to Site A being in a location that is less disturbed and Site B being in a more developed area. Fish and faunal bone make up most of the assemblages at both sites. This indicates hunting was actively practiced at these sites and they may also have been used as areas of habitation (Jones and Mikkelsen 2009; Jones, Mikkelsen, and Meyer 2012). The large percentage of fish remains is not surprising due to the proximity to the ocean. Future research will be done to analyze more sites in the Study Area and develop a better understanding of archaeology in the Pismo Coast.

Layers

Historic Fires of California, 1900-2019

An interactive map showing spatial distribution of large fires that burned across California for the past 120 years.

A study from Environmental Research Letters showed that there has been an increase of 10% of wildfires each decade since 1984.

Using the tabs above:

- The Legend will display the current layers selected.
- Click on the 'Layers' tab to change what fire layers are displayed.
- Select different layers to have them appear on the map.
- Browse between layers of historic fire data to show the areas burned for that time period.
- Click on impacted areas to show information of that fire, such as year, fire name, acres burned, and county it occurred in.
- Toggle the layers of the last 40 years to see a growing

Course Student Learning Outcomes Report
MATH 290 INTRODUCTION TO RESEARCH

Student Learning Outcomes

1. Examine and research problems in mathematics or statistics.
2. Express in writing the findings from their research and find opportunities for publication.

Catalog Description:

Introduces students to the fundamentals of mathematical research, including reading journal articles and working on open problems in mathematics. Includes instruction on writing up research results using an industry standard typesetting program, such as LaTeX, and finding opportunities to have original work published or disseminated.

Schedule Description:

Introduces students to the fundamentals of mathematical research, including reading journal articles and working on open problems in mathematics. Prerequisite: MATH 247, MATH 283 or MATH 287. Or concurrent enrollment in MATH 287. Transfer: CSU.

Finding open problems for students to research

- Problems in *The College Mathematics Journal* and *The American Mathematical Monthly* by the Mathematical Association of America.
- Other sources of problems, like the *MathAMATYC Educator*.
- Problems provided by companies and institutions according to the PIC Math Methodology (NSF and NSA sponsored).

Finding paths to publication:

- Problems in *The College Mathematics Journal* and *The American Mathematical Monthly* by the Mathematical Association of America and other journals.

Thanks to the work and collaboration of: • Robert Schwennicke

The condition $\frac{x_{n+1}}{x_n} \rightarrow 1$ as $n \rightarrow \infty$ implies that sequence $(x_n)_{n \geq 1}$ is weakly monotone, and by the reference below, this is sufficient to apply the Cauchy condensation test.

4- Spaghetti Design Challenge Lab

- **Objective:** Students are to work in groups to design and build a structure made entirely from pieces of uncooked spaghetti connected by masking tape. The objective of your structure is to suspend a penny as far from the edge of your fixed end of the structure.
- **The Engineering Design Process:** Your team will use the engineering design process below to design, build, and test your structure.

Competition

The goal of your final tasks are to make **Boe-Bot Robot** complete a basic track with various instructions and tasks. The following diagram shows the 18" x 23" rectangular track and the tasks required: This program will make Boe-Bot move in a rectangular path

Task 1: should start at Station 1 and move FORWARD to Station 2. After **Boe-Bot Robot** has arrived at Station 2, the beeper must sing a tune while the LED flashes in between each note.

Task 2: should move FORWARD to Station 3.

Task 3: should move BACKWARDS to Station 4.

Task 4: should move FORWARD to Station 1 and stop in the same orientation which it started.
